# Interface

Mode selectors

These buttons will only allow for one mode to be selected at a time. Each mode has a different gain setting to help with structuring your mix properly from the start.

Instruments- Use this setting on every track that contains an audio file that you do not want at the front of your mix.
Bus/Group- Use this setting on Aux/Group tracks that have a number of instruments all grouped together with their outputs going into this tracks input
Vox/Lead- Use this setting on all lead vocals and any solo or lead instruments you want to appear at the front of your mix.

All

Pressing the ALL button will turn Analyse on for every copy of Structure in your session

Analyse

Analyse mode will start the process of measuring the EBU level again. The indicator light above will turn green when it has properly analysed the level coming in and applied the correct gain adjustment.

Structure by default loads with Analyse mode ON as indicated by the orange light.

Quick Start

Load Structure up by clicking on any insert and selecting Structure from the DAW plugin list, you will find it listed under Audio Vitamins, however in ProTools you will find Structure in the Other sub-menu option and Cubase users will find Structure in the main list.
